Filter Systems

Filter Systems

- **The First Filter** is a sediment filter and can reduce sediment from 50 down to sub-1 micron in size, depending on the filter you install. Finer filters may need to be changed more often.
- **The Second Filter** is usually a carbon filter and reduces chlorine and other organic contaminants. This filter can be specified as a GAC (Granular Activated Carbon) or a CBC (Carbon Block Cartridge).
- **The Third Filter** usually is a CBC filter to polish the taste and remove anything that may have gotten this far.
